

4/16/76 Isolation of A DNA Adduct

Background: Over the past (4) months, Bill Busby and Bob Crog have established an hydrolysis method and an HPLC separation for an "adduct" in several *in vitro* incubation samples. I am now going to isolate enough material for physico-chemical studies.

Chromatogram:

Other hydrolysates had different profiles, but they all had peak 1. The difference between hydrolysates was in the way they were hydrolyzed.
